

John Quixley – FujiFilm

John has a long history in the printing industry, where his early years were spent in Melbourne as an apprentice litho platemaker. His experience in prepress as a result of that apprenticeship has served him well, as the experience he gained provided a broad understanding of the industry. John moved from the production side to a support role in the late 1980's and over the years has provided technical support for hardware, software and consumable products. He has found the changes required over the years both interesting & challenging as the industry moved from analogue to digital production methods.

John is currently employed by Fujifilm Australia as a Service & Application Support Technician in Graphic Systems. In this role he primarily supports the various software products for both offset & wide format markets. He is based out of Brisbane but service customers in all states as required. He has a long history with colour management, having first been exposed to this as the market was moving from analogue towards digital proofing. This later resulted in exposure to the Wide & Grand format side of the industry. John particularly enjoys the technical hands on roles & problem solving as opportunities are presented.

A hobby that has been with him since his early teens is photography, and having a knowledge and an understanding of colour management has been invaluable in not only photography but also in his day-to-day work.
